PREFACE

The following report, *Edmonton Demographic Indicators, 1988*, provides a picture of the Edmonton population, mostly for the period around the Civic Census of Spring 1987.

As in reports for previous years, the format and the content were chosen as a response to public and interdepartmental inquiries to the Planning and Development Department. As in past reports, the attempt has been to provide demographic information on as fine a level as possible, without compromising substance.

This report was prepared by Avi Akkerman, assisted by Tim Ford. The annual reports, *Edmonton Demographic Indicators*, are issued by the Forecasting and Policy Development Group, Strategic Planning Branch, The City of Edmonton Planning and Development Department.

CHAPTER 1 INTRODUCTION

The annual series, *Edmonton Demographic Indicators* are source documents. Much of the present report is based on the latest demographic data available, namely that of the 1987 Civic Census and that of the 1986 Federal Census of Canada. In this sense it is a continuation of the *Edmonton Demographic Indicators, 1987* (Planning and Development Department, 1988*a*).

This report is divided into five chapters which provide the context for recent trends in Edmonton's population growth, as well as a more detailed analysis of Edmonton subareas. Unless otherwise specified, the reference to Edmonton, whether in text or tables, implies the geographic area of approximately 701 square kilometres, delineated by the boundaries of the City of Edmonton, the capital of Alberta.

Edmonton had population of approximately 581,000 in mid-1988, of which approximately 287,000 were males and 294,000 were females. Approximately 8% of the population were children 0-4, and approximately 8% were persons 65 + .

Population growth in Edmonton has followed overall trends in the province, and to a lesser extent those of Canada as a whole (Table 1). The trends in household and population growth indicate further that average household size in Edmonton is declining along with slower increase in both population and households (Table 2). It is difficult to speculate on future trends in population growth and in household size, but if Edmonton's demography will continue in the general path of Alberta (see Table 3), then slower population increase and further decline in average household size can be expected. This proposition summarizes in essence observations in the following chapters.

Table 3 reviews the recent trends in family and population growth in Alberta, and the possible directions these trends will take in the near future. Three different growth directions are presented in the Table, based on three scenarios and projections series of the Alberta Bureau of Statistics.

TABLE 1. POPULATION, EDMONTON, ALBERTA AND CANADA, 1948 - 1988

CHAPTER 2

TRENDS IN EDMONTON DEMOGRAPHY

As shown recently (Planning and Development Department, 1988*b*) perhaps the most noteworthy feature of Edmonton's demography in the eighties has been the rise in fertility rates. These rates indicate an overall consistency between Edmonton and Alberta. At the same time, however, it should be noted that Edmonton has enjoyed consistently higher birth rates than the rest of Canada (Table 4), lower mortality rates (Table 5) and higher nuptiality rates (Table 6).

Table 7 shows in detail distribution of the Edmonton population by age and sex during the past decade. Most significantly, it is evident that the increase in the number of children 0-4, 5-9, 10-14, is slowing down whereas the number of persons 65+ is rapidly increasing, particularly in recent years.

Table 8 shows the distribution of population during the past decade by sex and marital status. The trend emerging from observation of Table 8 indicates increasing proportion of divorced persons and decreasing proportion of married persons. This trend appears to be more prominent among the city females than males.

The trend that emerges from these observations is slower, albeit not negative, natural increase in the near future. Consistent with this trend, one may also expect decrease in family size in Edmonton. While no Civic Census statistics is compiled on families as such, observations and estimates of average household size in Edmonton as a whole (Table 2) as well as in subareas of the city support this proposition. In the twelve planning districts into which the city was subdivided in the past by the Planning and Development Department gradual and consistent decrease in average household size was experienced in the past decade (see Table 9).

CHAPTER 3

DISTRIBUTION OF SPECIAL POPULATIONS IN EDMONTON

Segments of population that require special service or care, or those on which marketing activities focus in particular, are presented in Tables 10 - 17. The information provided in the tables of this chapter refers to 149 small areas of Edmonton. All of the small areas are congruent with census tracts or with conglomerations of census tracts. Census tracts are geographic reference units identical in both the Federal and the Civic Censuses. Official City of Edmonton census tract map is enclosed to this report (see also Chapter 5).

Table 10 provides concise information on population age distribution in census tracts or their conglomerations. The table is a replication of previously published data (Planning and Development, 1988*a*), and is presented here again in order to facilitate proper usage of the tables that follow in this chapter.

Table 11 provides summary demographic statistics for census tracts or their conglomerations. This includes distribution of households, and percentage distribution of persons 0-17 and 65+. Proportion of persons 0-17 and 65+ in total population is the dependency ratio of the population. Approximate area of each census tract in square kilometres is also provided, along with population and household densities per square kilometre.

Tables 12, 13 and 14 rank city census tracts or their conglomerations in descending order, by percentage of persons 0-4, 5-14 and 65+, respectively. Table 15 ranks census tracts by numbers of recent immigrants from outside the country, in descending order. Table 16 ranks census tracts or their conglomerations by percentage of persons who had resided three years or more at their address at the time of enumeration. This provides assessment of residential stability in the different subareas of Edmonton. Table 17 ranks census tracts or their conglomerations by unemployment rate. The table also lists total population along with total labour force in each census tract. Total labour force is the number of persons employed full-time, employed part-time and unemployed (unemployed defined as 'not employed and looking for work'). The unemployment rate is calculated as the percentage of persons unemployed in total labour force.

CHAPTER 4 EDMONTON DEMOGRAPHIC DATABASE AND ITS SOURCES

The Edmonton Civic Census is a major source of demographic estimates and forecasts for the City. With the release of the 1986 Federal Census of Canada, an opportunity to evaluate the Civic Census accuracy lends itself. Tables 18, 19 and 20 provide a comparison between the Federal and Civic Censuses from 1976 to 1986. Although the evaluation of discrepancies between the Federal and Civic Censuses may often be a matter of subjective point of view, it should be noted that the reference date of the Civic Census is approximately April 1, while that of the Federal Census is July 1, or thereabout.

An important source of demographic statistics is the enrollment enumeration of students in public, separate and private schools in Edmonton. Tables 21 and 22 show single year age groups for 1983 through 1987 from the Civic Census and the enrollment enumerations, respectively.

Fertility and mortality rates for Edmonton are calculated periodically from vital statistics obtained from Alberta Community and Occupational Health and from the Edmonton Board of Health. Actual numbers of births and deaths over past several years are shown in Tables 23 and 24, respectively. Fertility and mortality rates as well as annual population age-sex distribution compose the Edmonton demographic database used for population projections (Planning and Development, 1988a).

CHAPTER 5

POPULATION ESTIMATES AND FORECASTS FOR EDMONTON

Experience of past years shows that different agencies use substantially different subarea boundaries for their catchment or service areas within Edmonton. The tables in this chapter provide essential demographic information for four different sets of city subareas. The tabulated information is based on data obtained from the 1987 Civic Census for Edmonton's 638 census enumeration areas. Each of the enumeration areas was allocated to the appropriate subarea under consideration. In cases where a subarea boundary splits a census enumeration area, the whole enumeration area was allocated to a single subarea. A map of census enumeration areas and census tracts is attached to this report. The tables in this chapter give the demographic statistics for the four sets of city subareas. The four sets of subareas and their determination by census enumeration areas are specified in Appendices A, B, C and D.

Tables 25 and 26 provide a comprehensive description of the demographic distribution of population and households by postal zones. Tables 27 and 28 provide the same demographic breakdown for the twelve planning districts used in the past by the Planning and Development Department. Tables 29 and 30 refer to boundaries of city sectors, and tables 31 and 32 refer to boundaries of Transportation Department's traffic districts. The presented population and household breakdowns match closely, but not exactly, boundaries delineated by the different agencies servicing these subareas. The boundaries used for the purpose of tabulating the data are detailed in Appendices A, B, C and D, respectively. The delineations of boundaries for postal zones, planning districts, city sectors and traffic districts are presented in Maps 1, 2, 3 and 4, respectively.

Population forecasts for traffic districts up to the year 1993, are provided in Table 33. The traffic district forecasts are based on the official, city-wide population projections in Table 34. While the city-wide population projections provide age-sex specific figures for the whole city, the traffic district forecasts provide population totals for each district. The traffic district forecasts allocate portions of the city's population as provided by the city-wide projections, to the 31 traffic districts into which the city is divided. The allocation is done on the basis of both observed population growth within the traffic districts, and on trends in servicing and housing starts.

The city-wide population projections provide very detailed estimates by 5-year age groups and sex. The traffic district forecasts allocate city-wide population totals to the 31 different traffic districts. The allocation to traffic district yields rounded figures only. The control totals for the whole city, therefore, match only approximately between the two tables. Both the city-wide projections and the traffic district forecasts presented in Tables 33 and 34 are extracts from longer range projections and forecasts produced annually or bi-annually (see Planning and Development, 1988*b*, 1988*c*).
